Background

### **Introduction:** Maximum Flow and Minimum Cut

#### Maximum Flow and Minimum Cut

- Two very rich algorithmic problems.
- Cornerstone problems in combinatorial optimization.
- Beautiful mathematical duality.

## Introduction: Maximum Flow and Minimum Cut

#### Maximum Flow and Minimum Cut

- Two very rich algorithmic problems.
- Cornerstone problems in combinatorial optimization.
- Beautiful mathematical duality.

#### Nontrivial Applications / Reductions

- Data mining.
- Open-pit mining.
- Project selection.
- Airline scheduling.
- Bipartite matching.
- Baseball elimination.
- Network connectivity.

- Network reliability.
- Distributed computing.
- Egalitarian stable matching.
- Security of statistical data.
- Network intrusion detection.
- Multi-camera scene reconstruction.
- Many many more ?

### Flow Network

Description. A flow network is a tuple G = (V, E, s, t, c):

- Directed graph G = (V, E), with source  $s \in V$  and sink  $t \in V$ .
- Assume all nodes are reachable from *s*, no parallel edges.
- Capacity c(e) > 0 for each edge  $e \in E$ .

#### Flow Network

Description. A flow network is a tuple G = (V, E, s, t, c):

- Directed graph G = (V, E), with source  $s \in V$  and sink  $t \in V$ .
- Assume all nodes are reachable from *s*, no parallel edges.
- Capacity c(e) > 0 for each edge  $e \in E$ .

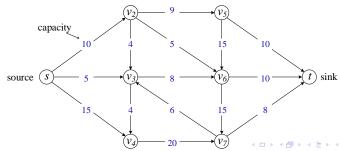

Intuition. Material flowing through a transportation network; material originates at source and is sent to sink.

#### Flow Network

Description. A flow network is a tuple G = (V, E, s, t, c):

- Directed graph G = (V, E), with source  $s \in V$  and sink  $t \in V$ .
- Assume all nodes are reachable from s, no parallel edges.
- Capacity c(e) > 0 for each edge  $e \in E$ .

Intuition. Material flowing through a transportation network; material originates at source and is sent to sink.

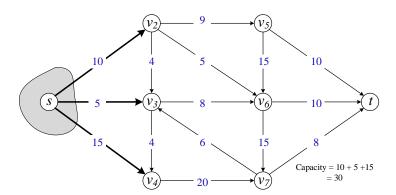

**Def.** An *s*-*t* cut is a partition (A, B) of V with  $s \in A$  and  $t \in B$ .

**Def.** An *s*-*t* cut is a partition (A, B) of V with  $s \in A$  and  $t \in B$ .

**Def.** The capacity of a cut (A, B) is  $cap(A, B) = \sum_{e \text{ out of } A} c(e)$ 

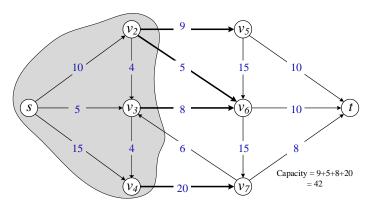

**Def.** An *s*-*t* cut is a partition (A, B) of V with  $s \in A$  and  $t \in B$ .

**Def.** The capacity of a cut (A, B) is  $cap(A, B) = \sum_{e \text{ out of } A} c(e)$ 

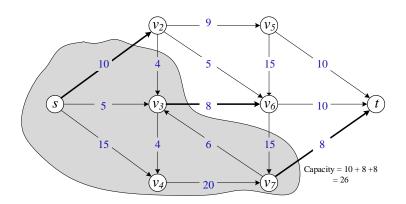

**Def.** An *s*-*t* cut is a partition (A, B) of V with  $s \in A$  and  $t \in B$ .

**Def.** The capacity of a cut (A, B) is  $cap(A, B) = \sum_{e \text{ out of } A} c(e)$ 

#### Minimum Cut Problem

**Minimum** *s-t* **Cut**: Find an *s-t* cut of minimum capacity.

### Flows

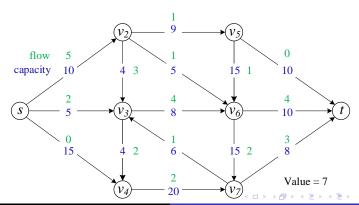

**Def.** An s-t flow f is a function that satisfies:

- Capacity: for each  $e \in E$ :  $0 \le f(e) \le c(e)$
- Conservation: for each  $v \in V \{s, t\}$ :  $\sum_{e \text{ in to } v} f(e) = \sum_{e \text{ out of } v} f(e)$

### Flows

#### **Def.** An s-t flow f is a function that satisfies:

- Capacity: for each  $e \in E$ :  $0 \le f(e) \le c(e)$
- Conservation: for each  $v \in V \{s, t\}$ :  $\sum_{e \text{ in to } v} f(e) = \sum_{e \text{ out of } v} f(e)$

### Maximum Flow Problem

**Def.** The value of a flow 
$$f$$
 is:  $v(f) = \sum_{e \text{ out of } s} f(e) - \sum_{e \text{ in to } s} f(e)$ 

### Maximum Flow Problem

**Def.** The value of a flow 
$$f$$
 is:  $v(f) = \sum_{e \text{ out of } s} f(e) - \sum_{e \text{ in to } s} f(e)$ 

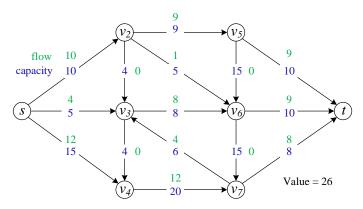

**Max flow problem.** Find an *s-t* flow of maximum value.

### Maximum Flow Problem

**Def.** The value of a flow f is:  $v(f) = \sum_{e \text{ out of } s} f(e) - \sum_{e \text{ in to } s} f(e)$ 

**Max flow problem.** Find an *s-t* flow of maximum value.

# Why the Greedy Algorithm Fails?

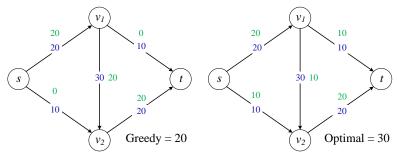

**Observation**: Once greedy algorithm increases flow on an edge, it never decreases it.

## Why the Greedy Algorithm Fails?

**Observation**: Once greedy algorithm increases flow on an edge, it never decreases it.

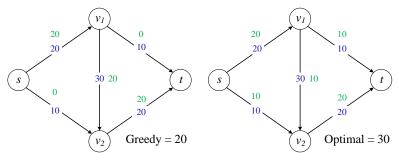

Consider this example: the unique max flow has  $f^*(v_1, v_2) = 10$ , but the greedy algorithm could choose  $s \to v_1 \to v_2 \to t$  as the first augmenting path, each with f(e) = 20.

## Why the Greedy Algorithm Fails?

**Observation**: Once greedy algorithm increases flow on an edge, it never decreases it.

Consider this example: the unique max flow has  $f^*(v_1, v_2) = 10$ , but the greedy algorithm could choose  $s \to v_1 \to v_2 \to t$  as the first augmenting path, each with f(e) = 20.

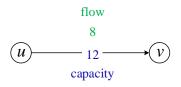

Bottom Line: Need some mechanism to "undo" a bad decision.

# Solution: Residual Graph

Original edge:  $e = (u, v) \in E$ .

• Flow f(e), capacity c(e).

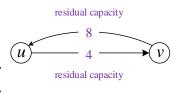

Original edge:  $e = (u, v) \in E$ .

• Flow f(e), capacity c(e).

Residual edge:  $e = (u, v) \in E$ .

- "Undo" flow sent.
  - e = (u, v) and  $e^R = (v, u)$ .
  - Residual capacity:

$$c_f(e) = \begin{cases} c(e) - f(e) & \text{if } e \in E \\ f(e) & \text{if } e^R \in E \end{cases}$$

Residual Network: 
$$G_f = (V, E_f, s, t, c_f)$$
.

- Residual edges with positive residual capacity.
- $E_f = \{e \mid f(e) < c(e)\} \cup \{e^R \mid f(e) > 0\}$

Residual Network:  $G_f = (V, E_f, s, t, c_f)$ .

- Residual edges with positive residual capacity.
- $E_f = \{e \mid f(e) < c(e)\} \cup \{e^R \mid f(e) > 0\}$

**Greedy Algorithm**: Run the greedy algorithm on  $G_f$  to get a max flow f'. For G, when there is a flow on a reverse edge, negates flow on the corresponding forward edge (f).

⇒ the key idea for Ford-Fulkerson algorithm.

Residual Network:  $G_f = (V, E_f, s, t, c_f)$ .

Max-flow Min-cut Theorem. [Elias-Feinstein-Shannon 1956, Ford-Fulkerson 1956] The value of the max flow is equal to the value of the min cut.

#### MAXIMAL FLOW THROUGH A NETWORK

L. R. FORD, IR. AND D. R. FULKERSON

Introduction. The problem discussed in this paper was formulated by T. Harris as follows:

"Consider a rail network connecting two cities by way of a number of intermediate cities, where each link of the network has a number assigned to it representing its capacity. Assuming a steady state condition, find a maximal flow from one given city to the other."

While this can be set up as a linear programming problem with as many equations as there are cities in the network, and hence can be solved by the simplex method (1), it turns out that in the cases of most practical interest, where the network is planar in a certain restricted sense, a much simpler and more efficient hand computing procedure can be described.

THE TRANSACTIONS ON INPODMATION THROBY

A Note on the Maximum Flow Through a Network\*

P. ELIAST, A. FEINSTEINT, AND C. R. SHANNONS

consists of a number of branches, each of which has a limited capaall simple cut-sets. This theorem is applied to solve a more general problem, in which a number of input nodes and a number of output

generally, any conveying system of limited capacity as, We assign a value to a simple cut-set by taking the sum of for example, a railroad system, a power feeding system, capacities of branches in the cut-set, only counting or a network of pipes, provided in each case it is possible espacities, however, from the left part to the right part to assign a definite movimum allowed rate of flow over a for branches that are unidirectional. Note that the given branch. The links may be of two types, either one direction of an unidirectional branch cannot be deduced directional (indicated by arrows) or two directional, in from its appearance in the graph of the network. A branch which case flow is allowed in either direction at anything is directed from left to right in a minimal cut-set if, and up to maximum capacity. At the nodes or junction points only if, the arrow on the branch points from a node in the of the network, any redistribution of incoming flow into left part of the network to a node in the right part. Thus,

Sammary-This note discusses the problem of maximizing the from one terminal to the other in the original network noises through at least one branch in the cut-set. In the city. The main result is a theorem: The maximum possible flow from network above, some examples of out-sets are (d, e, f), and (b, c, c, q, h), (d, q, h, i). By a simple cut-set we will mean a cut-set such that if any branch is omitted it is no longer a cut-set. Thus (d, e, f) and (b, c, e, g, h) are simple cut-sets while (d, g, h, i) is not. When a simple cut-set is NONSIDER a two terminal network such as that detected from a connected two-terminal network, the netof Fig. 1. The branches of the network might work falls into exactly two parts, a left part containing the represent communication channels, or, more left terminal and a right part containing the right terminal.

Algorithm Course@SJTU Xiaofeng Gao Network Flow 39/53

**Proof.** We prove both simultaneously by showing TFAE:

- (1) There exists a cut (A, B) such that v(f) = cap(A, B).
- (2) Flow f is a max flow.
- (3) There is no augmenting path relative to f.
- $(1) \Rightarrow (2)$  This was the corollary to weak duality lemma.

**Proof.** We prove both simultaneously by showing TFAE:

- (1) There exists a cut (A, B) such that v(f) = cap(A, B).
- (2) Flow f is a max flow.
- (3) There is no augmenting path relative to f.
- $(1) \Rightarrow (2)$  This was the corollary to weak duality lemma.
- (2)  $\Rightarrow$  (3) We show contrapositive. Let f be a flow. If there exists an augmenting path, then we can improve f by sending flow along path.

 $(3) \Rightarrow (1)$  Let f be a flow with no augmenting paths. Let A be set of vertices reachable from s in residual graph.

 $(3) \Rightarrow (1)$  Let f be a flow with no augmenting paths. Let A be set of vertices reachable from s in residual graph.

By definition of A,  $s \in A$ . By definition of f,  $t \notin A$ .

 $(3) \Rightarrow (1)$  Let f be a flow with no augmenting paths. Let A be set of vertices reachable from s in residual graph.

By definition of A,  $s \in A$ . By definition of f,  $t \notin A$ .

$$v(f) = \sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to } A} f(e)$$

$$= \sum_{e \text{ out of } A} c(e) - 0$$

$$= cap(A, B)$$

Edge 
$$e = (v, w)$$
 with  $v \in B$ ,  $w \in A$  must have  $f(e) = 0$ ;  
Edge  $e = (v, w)$  with  $v \in A$ ,  $w \in B$  must have  $f(e) = c(e)$ .

Algorithm Course @ SJTU Xiaofeng Gao Network Flow 41/53

**Assumption.** All capacities are integers between 1 and C.

**Assumption.** All capacities are integers between 1 and *C*.

**Invariant.** Every flow value f(e) and every residual capacity  $c_f(e)$  remains an integer throughout the algorithm.

**Proof.** By induction on the number of augmenting paths.

**Assumption.** All capacities are integers between 1 and *C*.

**Invariant.** Every flow value f(e) and every residual capacity  $c_f(e)$  remains an integer throughout the algorithm.

**Proof.** By induction on the number of augmenting paths.

**Theorem.** The algorithm terminates at most  $val(f^*) \le n \times C$  augmenting pathes, where  $f^*$  is a max flow.

**Proof.** Each augmentation increase value by at least 1.

**Assumption.** All capacities are integers between 1 and C.

**Invariant.** Every flow value f(e) and every residual capacity  $c_f(e)$  remains an integer throughout the algorithm.

**Proof.** By induction on the number of augmenting paths.

**Theorem.** The algorithm terminates at most  $val(f^*) \le n \times C$  augmenting pathes, where  $f^*$  is a max flow.

**Proof.** Each augmentation increase value by at least 1.

**Corollary.** Ford-Fulkerson runs in O(mnC) time.

**Proof.** Can use either BFS or DFS to find an augmenting path in O(m) times.

**Assumption.** All capacities are integers between 1 and C.

**Invariant.** Every flow value f(e) and every residual capacity  $c_f(e)$  remains an integer throughout the algorithm.

**Proof.** By induction on the number of augmenting paths.

**Theorem.** The algorithm terminates at most  $val(f^*) \le n \times C$  augmenting pathes, where  $f^*$  is a max flow.

**Proof.** Each augmentation increase value by at least 1.

**Corollary.** Ford-Fulkerson runs in O(mnC) time.

**Proof.** Can use either BFS or DFS to find an augmenting path in O(m) times.

**Integrality Theorem.** There exists an integral max flow f.

**Proof.** Since algorithm terminates, theorem follows from integrality invariant (and augmenting path theorem).

## Ford-Fulkerson: Exponential Number of Augmentations

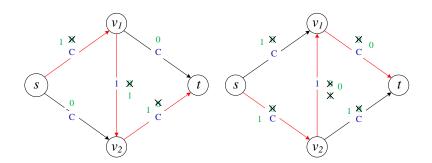

Q. Is generic Ford-Fulkerson algorithm polynomial in input size? Input size:  $m, n, \log C$ 

## Ford-Fulkerson: Exponential Number of Augmentations

Q. Is generic Ford-Fulkerson algorithm polynomial in input size? Input size:  $m, n, \log C$ 

A. No. If max capacity is C, then algorithm can take C iterations.

ABSTRACT. This paper presents new algorithms for the maximum flow problem, the Hitchcock transportation problem, and the general minimum-cost flow problem. Upper bounds on the numbers of steps in these algorithms are derived, and are shown to compare favorably with upper bounds on the numbers of steps required by earlier algorithms. Dokl. Akad. Nauk SSSR Tom 196 (1970), No. 4

ALGORITHM FOR SOLUTION OF A PROBLEM OF MAXIMUM FLOW IN A NETWORK WITH

POWER ESTIMATION
UDC 518.5
E. A. DINIC

Different variants of the formulation of the problem of maximal stationary flow in a network and its many applications are given in (11). There also is given an appetude solving problem in the case where the initial data are intergers (or, what is equivalent, connecessable). In the general case this algorithm requires perlaintary resoluting off of the initial data, i.e. only an approximate solution of the problem is possible. In this connection the napidity of convergence of the algorithm is inversely reconciled to the relative specision.

In the present week an algorithm is presented which solves the problem exactly in the general case after no more than  $C_n^{2}p$  (machine) operations, where n is the number of nodes of the net, p is the number of acres in it, and C is a constant nor depending on the network. For integer data this algorithm, like the algorithm of Ferd and Fulkerson, gives an integer solution with a supplementary estimate of the number of operations  $C_n^{2}p$  plus an estimate of the last:

Edmond-Karp 1972 (USA)

# Capacity Scaling

**Intuition.** Choosing path with highest bottleneck capacity increases flow by max possible amount.

- Don't worry about finding exact highest bottleneck path.
- Maintain scaling parameter  $\Delta$ .
- Let  $G_f(\Delta)$  be the subgraph of the residual graph consisting of only arcs with capacity at least  $\Delta$ .

# Capacity Scaling (cont.)

## **Algorithm 4:** Scaling Max-Flow Algorithm

```
Input: G = (V, E), c, s, t
 1 foreach e \in E do
 f(e) \leftarrow 0;
 3 G_f \leftarrow residual graph;
 4 \Delta \leftarrow smallest power of 2 greater than or equal to C;
 5 while \Delta > 1 do
        G_f(\Delta) \leftarrow \Delta-residual graph;
 6
        while there exists augmenting path P in G_f(\Delta) do
 7
            f \leftarrow Argument(f, c, P);
 8
            update G_f(\Delta);
 9
        \Delta \leftarrow \Delta/2;
10
11 return f;
```

**Assumption.** All edge capacities are integers between 1 and C.

Algorithm Course@SJTU

**Assumption.** All edge capacities are integers between 1 and C.

**Invariant**. The scaling parameter  $\Delta$  is a power of 2.

**Proof**. Initially a power of 2; each phase divides  $\Delta$  by exactly 2.

**Assumption.** All edge capacities are integers between 1 and C.

**Invariant**. The scaling parameter  $\Delta$  is a power of 2.

**Proof**. Initially a power of 2; each phase divides  $\Delta$  by exactly 2.  $\square$ 

**Integrality Invariant.** Throughout the algorithm, all flow and residual capacity values are integral.

**Proof.** Same as for generic Ford-Fulkerson.

**Assumption.** All edge capacities are integers between 1 and C.

**Invariant**. The scaling parameter  $\Delta$  is a power of 2.

**Proof.** Initially a power of 2; each phase divides  $\Delta$  by exactly 2.  $\square$ 

**Integrality Invariant.** Throughout the algorithm, all flow and residual capacity values are integral.

**Proof**. Same as for generic Ford-Fulkerson.

**Correctness.** If the algorithm terminates, then f is a max flow.

**Proof.** By integrality invariant, when  $\Delta = 1 \Rightarrow G_f(\Delta) = G_f$ .

Upon termination of  $\Delta = 1$  phase, there are no augmenting paths.

**Lemma 1.** The outer while loop repeats  $1 + \lceil \log_2 C \rceil$  times. **Proof.** Initially  $C \le \Delta < 2C$ .  $\Delta$  decreases by a factor of 2 each iteration.

**Lemma 1.** The outer while loop repeats  $1 + \lceil \log_2 C \rceil$  times. **Proof.** Initially  $C \le \Delta < 2C$ .  $\Delta$  decreases by a factor of 2 each iteration.

**Lemma 2.** Let f be the flow at the end of a  $\Delta$ -scaling phase. Then the value of the maximum flow is at most  $v(f) + m\Delta$  (proof on next slide).

**Lemma 1.** The outer while loop repeats  $1 + \lceil \log_2 C \rceil$  times. **Proof.** Initially  $C \le \Delta < 2C$ .  $\Delta$  decreases by a factor of 2 each iteration.

**Lemma 2.** Let f be the flow at the end of a  $\Delta$ -scaling phase. Then the value of the maximum flow is at most  $v(f) + m\Delta$  (proof on next slide).

**Lemma 3.** There are at most 2m augmentations per scaling phase.

**Proof.** Let f be the flow at the end of the previous scaling phase.

Lemma  $2 \Rightarrow v(f^*) \le v(f) + m(2\Delta)$ 

Each augmentation in a  $\Delta$ -phase increases v(f) by at least  $\Delta$ .

**Lemma 1.** The outer while loop repeats  $1 + \lceil \log_2 C \rceil$  times. **Proof.** Initially  $C \le \Delta < 2C$ .  $\Delta$  decreases by a factor of 2 each iteration.

**Lemma 2.** Let f be the flow at the end of a  $\Delta$ -scaling phase. Then the value of the maximum flow is at most  $v(f) + m\Delta$  (proof on next slide).

**Lemma 3.** There are at most 2m augmentations per scaling phase.

**Proof.** Let f be the flow at the end of the previous scaling phase.

Lemma 
$$2 \Rightarrow v(f^*) \le v(f) + m(2\Delta)$$

Each augmentation in a  $\Delta$ -phase increases v(f) by at least  $\Delta$ .

**Theorem.** The scaling max-flow algorithm finds a max flow in  $O(m \log C)$  augmentations. It can be implemented to run in  $O(m^2 \log C)$  time.

Algorithm Course @SJTU Xiaofeng Gao Network Flow 50/53

**Lemma 2.** Let f be the flow at the end of a  $\Delta$ -scaling phase. Then the value of the maximum flow is at most  $v(f) + m\Delta$ .

**Lemma 2.** Let f be the flow at the end of a  $\Delta$ -scaling phase. Then the value of the maximum flow is at most  $v(f) + m\Delta$ .

**Proof.** (almost identical to proof of max-flow min-cut theorem) We show that at the end of a  $\Delta$ -phase, there exists a cut (A, B) such that  $cap(A, B) \leq v(f) + m\Delta$ .

**Lemma 2.** Let f be the flow at the end of a  $\Delta$ -scaling phase. Then the value of the maximum flow is at most  $v(f) + m\Delta$ .

**Proof.** (almost identical to proof of max-flow min-cut theorem)

We show that at the end of a  $\Delta$ -phase, there exists a cut (A, B) such that  $cap(A, B) \leq v(f) + m\Delta$ .

Choose *A* to be the set of nodes reachable from *s* in  $G_f(\Delta)$ . By definition of *A*,  $s \in A$ . By definition of *f*,  $t \notin A$ .

**Lemma 2.** Let f be the flow at the end of a  $\Delta$ -scaling phase. Then the value of the maximum flow is at most  $v(f) + m\Delta$ .

**Proof.** (almost identical to proof of max-flow min-cut theorem)

We show that at the end of a  $\Delta$ -phase, there exists a cut (A, B) such that  $cap(A, B) \leq v(f) + m\Delta$ .

Choose *A* to be the set of nodes reachable from *s* in  $G_f(\Delta)$ . By definition of *A*,  $s \in A$ . By definition of *f*,  $t \notin A$ .

$$v(f) = \sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to } A} f(e)$$

$$\geq \sum_{e \text{ out of } A} (c(e) - \Delta) - \sum_{e \text{ in to } A} \Delta$$

$$= \sum_{e \text{ out of } A} c(e) - \sum_{e \text{ out of } A} \Delta - \sum_{e \text{ in to } A} \Delta$$

$$\geq cap(A, B) - m\Delta$$

Ford-Fulkerson Algorithm Improvement

# Augmenting-Path Algorithms: Summary

Year	Method	# Augmentations	Running Time
1955	augmenting path	nC	O(mnC)
1972	fattest path	$m\log(mC)$	$O(m^2 \log n \log(mC))$
1972	capacity scaling	$m \log C$	$O(m^2 \log C)$
1985	improved capacity scaling	$m \log C$	$O(mn \log C)$
1970	shortest augmenting path	mn	$O(m^2n)$
1970	level graph	mn	$O(mn^2)$
1983	dynamic trees	mn	$O(mn\log n)$

augmenting-path algorithms with m edges, n nodes, and integer capacities between 1 and C.
